

ADVANCED DB: MONGO DB LAB

Singh Sehmi – 146254 - BICS

ICS 3C

LAB 1:

5.- Execute the following commands and in a table explain what each one is for:

Command	Explanation
Show dbs	The following command shows what current databases are being used
Use analysisSuppliers	Allows you to switch to the database named "Analysis Supplier"

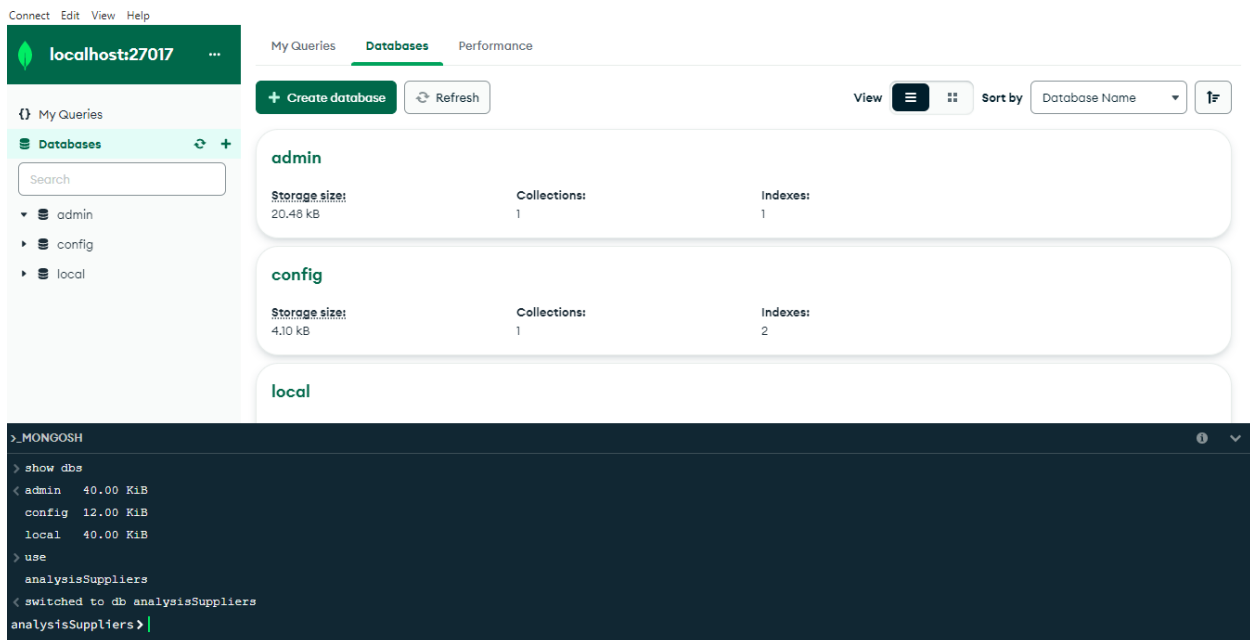

Fig 1a: Shows the output after running the above commands.

6.

Command	Function
Aggregate	Executes aggregation operations, such as \$group, by utilizing an aggregation pipeline.
Count	Calculates the total count of documents within a collection or a view.
Distinct	Retrieves the unique values observed for a given key within a collection or a view and presents them as output.
Group	Groups documents in a collection based on a specified key and applies aggregations to the grouped data.

mapReduce	Executes map-reduce aggregation on extensive datasets, facilitating data analysis and summarization.
Find	Filters and retrieves specific documents from a collection or a view based on defined criteria.
Insert	Inserts one or more documents.
Update	Updates one or more documents.
Delete	Deletes in one or more documents
findAndModify	Returns and modifies a single document.
parallelCollectionScan	perform a parallel scan operation on a collection
Logout	Terminates the current authenticated session.
Authenticate	Starts an authenticated session using a username and password.
createUser	Creates a new user.
dropUser	Removes a single user.
grantRolesToUser	Grants a role and its privileges to a user.
usersInfo	Returns information about the specified users.
renameCollection	Re-names the collection
Copydb	Copies the database
dropDatabase	Deletes the database
listCollection	retrieve a list of collections within a specific database
Drop	Removes the specified collection from the database.
Create	Creates a collection or a view.
Clone	Copies a collection or a view.
CreateIndexes	Creates a new index
shutdown	Shuts down the collection/view

    }
  ]
}

```

8. Command: `db.providers.find({ score: { $gt: 30 } })`

`db.providers.find({ score: { $lt: 10 } })`

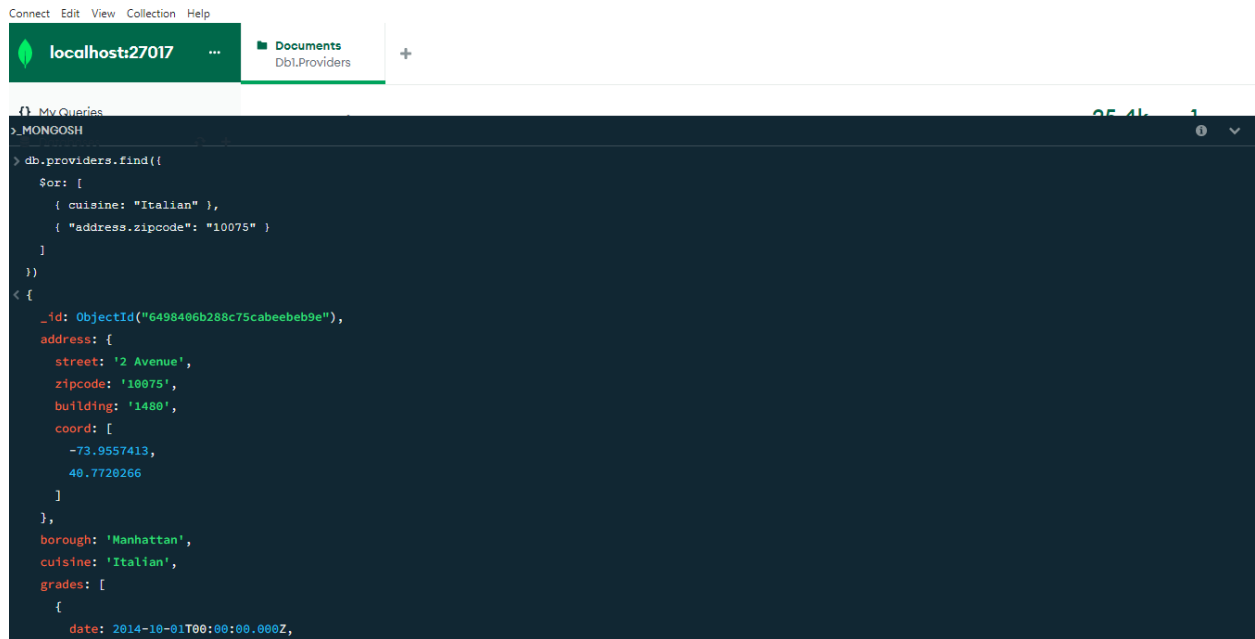

9. Command: db.providers.find({ cuisine: "Italian", "address.zipcode": "10075" })

The screenshot shows the MongoDB Compass interface. The top bar indicates the connection to 'localhost:27017' and the database 'Db1.Providers'. The left sidebar shows the 'Documents' tab for the 'Db1.Providers' collection. The main area displays a JSON document returned by the query `db.providers.find({ cuisine: "Italian", "address.zipcode": "10075" })`. The document contains the following fields: `_id` (ObjectId), `address` (object with `street`, `zipcode`, `building`, and `coord`), `borough` ('Manhattan'), `cuisine` ('Italian'), and `grades` (array of objects with `date`, `grade`, and `score`).

```
> MONGODB
> db.providers.find({ cuisine: "Italian", "address.zipcode": "10075" })
< {
  _id: ObjectId("6498406b288c75cabeebeb9e"),
  address: {
    street: '2 Avenue',
    zipcode: '10075',
    building: '1480',
    coord: [
      -73.9557413,
      40.7728266
    ]
  },
  borough: 'Manhattan',
  cuisine: 'Italian',
  grades: [
    {
      date: 2014-10-01T00:00:00.000Z,
      grade: 'A',
      score: 11
    },
    {
      date: 2014-01-16T00:00:00.000Z,
```
